

## MOBILAB DESKTOP

### Improve Patient Safety with Mobile Phlebotomy

**MobiLab Desktop** is the Windows Operating System version of our MobiLab product. It has the same functionality as MobiLab but allows the use of any barcode scanner with keyboard simulation. It also enables clinicians to manage specimen collection using their Computer on Wheels (COWs).

MobiLab Desktop can help improve patient safety at your hospital. It brings positive patient identification, positive specimen identification and specimen label printing to the bedside. By utilizing wireless and printer technology, MobiLab Desktop is designed to reduce patient identification and specimen labeling errors, while increasing the productivity of your phlebotomy and nursing staff.

Positive Patient ID – Barcode technology is used to positively identify a patient by wristband barcode at bedside. Phlebotomists also are required to confirm a secondary identification method in order to complete the Positive Patient ID process.

Bedside Label Printing – Specimen collection labels are generated at bedside through the use of portable label printers, significantly reducing the chance of mislabeled specimens.

Positive Specimen ID – After specimen collection and labeling, barcode technology again is used to confirm that appropriate specimens have been collected and correct labels have been applied. This step is integrated with the standard labeling process in order to streamline the process and to provide rapid collection documentation capabilities for the phlebotomist.

#### Key Advantages:

- ✓ Manage specimen collections using Computers on Wheels (COWs)
- ✓ Use off-the-shelf barcode scanners with keyboard simulation
- ✓ Decreases patient identification errors by using barcode identification technology
- ✓ Decreases mislabeled specimens by printing labels at the bedside
- ✓ Automatic and immediate notification of stat draws
- ✓ Improves phlebotomy workflow with mobile technology
- ✓ Integrates fully with the MEDITECH Laboratory Information System
- ✓ Decreases unnecessary venipunctures via real-time “Smart Draw” warnings
