

Iatric Systems understands physician needs and the Meditech™ system. Would physicians like to decrease the amount of time they spend hunting and pecking through Meditech in order to assess their patients? Are physicians requesting patient results on their handheld devices and in their offices? Would computer generated prescriptions assist in reducing the amount of time physicians spend transcribing data already in Meditech? Whether your organization's physician IT initiatives this year include reducing medication errors, making patient results available to physicians in customized ways or on handheld devices, or sharing patient results with physician office software, Iatric Systems can help you achieve these and other goals.

Here are just some of the ways we can assist:

- **Reduce Medication Errors with PDRx** – Physicians strive to provide quality patient care with minimal medication errors. Help them do so with **PDRx (Physician Discharge Prescriptions)** from Iatric Systems. **PDRx** automatically pulls a patient's current medication profile from the Meditech Pharmacy module, allowing the physician to quickly edit existing orders and add medications. In minutes, legal size printed prescriptions are generated and ready for the physician's signature. Because **PDRx** automatically organizes patients' medications and takes minutes to learn and use, physicians save valuable time. Additionally, since **PDRx** produces legible prescriptions, call-backs and medication errors caused by illegible hand writing are eliminated.
- **Improve Presentation of Clinical Results with VFMD** – Do physicians express frustration about spending time hunting and pecking through clinical data in Meditech? Have physicians at your organization expressed a desire for customized views of patient results? Meet physicians' needs for customized, well presented data with Iatric System's **Visual Flowsheet for Physicians (VFMD)**. **VFMD** presents Meditech data from diverse clinical applications in a windows based clinical flowsheet format that can be completely customized for individual physicians or physician groups. I&O calculations, graphing, trending, and links to Meditech routines, as well as links to the Internet and other software, are just some of the features of VFMD.
- **Deliver Meditech Patient Results to Physician Offices with POI** - Delivering patient results to physician offices has always been a challenge. Today, many physician offices have software systems which include patient electronic medical records. Unfortunately, most physician practice systems do not communicate with the Meditech HCIS. Overcome this obstacle and transmit Meditech patient results directly to physician office software systems with **Physician Office Integration (POI)** from Iatric Systems. **POI** pulls one HL7 feed of patient results out of Meditech, sending that feed to as many physician office software systems as needed, and **POI** provides this solution at a fraction of the cost of other interface options. Find out why **POI** has become one of Iatric Systems' hottest new products.
- **Make Clinical Data Available on Handheld Devices with MData** - More and more physicians today are using Palm and Pocket PC devices to assist in clinical care. **MData** from MercuryMD is a perfect fit for physicians who would like to view Meditech patient results on their handheld devices. Iatric Systems has partnered with MercuryMD to provide **MData** to the Meditech marketplace. Physicians can use the devices they already own, and physicians using **MData** have reported time savings of ½ - 2 hours per day!
