

EVENT NOTIFICATION SYSTEM

Automatic Notification of User-Defined Events

Event Notification System (ENS) monitors MEDITECH system activity, then automatically notifies users that specific activities have occurred. You no longer have to stop what you're doing to check if something has happened; ENS will check for you, and will notify you however it's most convenient for you.

What makes ENS special is that each user can decide not only which activities (e.g. CDS queries, ADT activity, lab results, caretaker messages) are important, but he/she also can decide how (via e-mail, pager, printer, and fax) he/she wants to be notified. With ENS, critical messages automatically reach their intended audience, while the user concentrates on patient care.

Key Advantages:

- ✓ Monitors ADT, NUR, LAB, caretaker activity, housekeeping activity, and query responses
- ✓ Messages via MOX, e-mail, pagers, faxes and networked printers
- ✓ Maintains full audit trail
- ✓ Allows for customized messages through NPR report writer
- ✓ Provides automatic notification of failed faxes
