

# Network Vulnerability Assessment

**Is Third Party Access Making Your Network Vulnerable?  
Take this quick assessment to find out.**

	Yes	No
1. Do you verify that only vendors with a valid business associate agreement are accessing your network?		
2. Do you check the device of each remote access attempt for valid firewall, valid malware detection, and system updates?		
3. Can you pull a report to show the access details of each third party accessing your network remotely?		
4. Do you use multiple factor authentication for each third party accessing your network remotely?		
5. Do you automatically block remote access if the BAA is out of date?		
6. Do you automatically block remote access if the network security criteria are not met?		
7. Do all of your third party vendors access your network through one VPN?		
8. Can you limit remote access to your network by time of day and days of the week?		

If you answered “**No**” to any of these questions, your network could be vulnerable. If you answered “**No**” to the majority of these questions, your network probably is vulnerable.

For information about our SecureRamp™ solution, which can overcome each of these challenges, [click here](#) or [request a meeting](#) to discuss your results of this assessment.
