

## UserSync

UserSync allows for your hospital to seamlessly sync its network user database to its MEDITECH Expanse database. This allows for better security and consistency with your hospital's users. This makes sure that when a new user is added, they are added across both databases as well as taken out of the system when they are no longer with the hospital. Learn more about what UserSync has to offer you and your hospital inside.

In today's environment of IT projects competing for your staff time and resources, it's more important than ever to eliminate tedious, time-consuming tasks. One such tedious task is matching the user information from your Active Directory to your MEDITECH User. As you are most likely aware, as the organization gains and loses employees, someone must manually update their user profiles in MEDITECH as well as your Active Directory. While it may seem like a simple task, it creates hours of work for your IT Analysts.

## Why UserSync?

UserSync takes the user's AD account and automatically sets them up in the MEDITECH MIS database, allowing for better security, integrity, and consistency in regard to your hospital's users.

### Key Benefits Include:

- Disables EHR users automatically once users are disabled in the network database
- References the network user information to update the MEDITECH user database
- Eliminates the additional steps of communication between departments is eliminated
- Achieves cost reduction by eliminating unnecessary communication and reducing the chances of mistakes

Network administrators, such as your IT analysts will save hours of time each week, allowing them to concentrate on higher priority tasks while simultaneously improving security, integrity, and consistency of your EHR databases.

UserSync from iatricSystems, provides automatic synchronization between your Active Directory and your MEDITECH user's database. UserSync constantly monitors your network for any edits to the databases. When these edits are detected, UserSync will automatically copy those edits into the MEDITECH User Database.

iatricSystems UserSync aims to target and alleviate current issues with user creation/deletion ranging security to consistency. UserSync helps eliminate these issues by:

Ensuring disabled users no longer have access when it comes to all new user creation

Providing a single source of truth by aggregating user data

Using the same mnemonic pattern when it comes to all new user creation

What's more, UserSync promotes a more secure environment for your sensitive PHI. For many organizations, this manual process often requires input from two different departments — with the network admins handling disabling users and the IT Analysts disabling them in MEDITECH. UserSync can solve these pain points without letting anything fall through the cracks.
